Classification - Outline (Example)

👉 Data training $D = \{x_i, y_i\}_{i=0}^N \subseteq \mathbb{R}^p \times \mathcal{K}$

Objective

Given training data $D = \{x_i, y_i\}_{i=0}^N$:

- ① learning a classification rule $\varphi : \mathcal{X} \rightarrow \mathcal{K}$.
- ② predicting new instances $\hat{\varphi}(x^*)$

Motivation

What is the bigger problem in (precise) Classification ?

- Precise models can produce many mistakes for hard to predict unlabeled instances.

- One way to recognize such instances and avoid making such mistakes too often → **Making a cautious decision.**

Precise Classification

Step ① Learning the conditional probability distribution $\mathbb{P}_{Y|\mathbf{x}^*}$.

Step ② Predicting the “optimal” label amongst $\mathcal{K} = \{m_1, \dots, m_K\}$, under $\mathcal{L}_{0/1}$ loss function, for a new instance \mathbf{x}^* :

$$m_{i_K} > m_{i_{K-1}} > \dots > m_{i_1} \iff P(y = m_{i_K} | \mathbf{x}^*) > \dots > P(y = m_{i_1} | \mathbf{x}^*)$$

- ☞ Pick out the most preferable label m_{i_K}
 \iff maximal probability plausible $P(y = m_{i_K} | \mathbf{x}^*)$

(Precise) Gaussian Discriminant Analysis

Applying Baye's rules to $P(Y = m_a | X = \mathbf{x}^*)$:

$$P(y = m_k | X = \mathbf{x}^*) = \frac{P(X = \mathbf{x}^* | y = m_k)P(y = m_k)}{\sum_{m_l \in \mathcal{K}} P(X = \mathbf{x}^* | y = m_l)P(y = m_l)}$$

Normality $P_{X|Y=m_k} \sim \mathcal{N}(\mu_{m_k}, \Sigma_{m_k})$ and precise marginal $\pi_{m_k} := P_{Y=m_k}$.

Imprecise Gaussian Discriminant Analysis (IGDA)

Objective : Making imprecise the parameter mean μ_k of each Gaussian distribution family $\mathcal{G}_k := P_{X|Y=m_k} \sim \mathcal{N}(\mu_k, \hat{\Sigma}_{m_k})$

Proposition : Using a set of posterior distribution \mathcal{P} ([4, eq 17]).

Decision Making in Imprecise Probabilities

Definition (Partial Ordering by Maximality [1])

Under $\mathcal{L}_{0/1}$ loss function and let $\mathcal{P}_{Y|\mathbf{x}^*}$ a set of probabilities then m_a is preferred to m_b if and only if

$$\inf_{\mathbb{P}_{Y|\mathbf{x}^*} \in \mathcal{P}_{Y|\mathbf{x}^*}} P(Y = m_a | \mathbf{x}^*) - P(Y = m_b | \mathbf{x}^*) > 0 \quad (1)$$

- ☞ This definition give us a partial order \succ_M
- ☞ The maximal element of partial order is the cautious decision :

$$Y_M = \{m_a \in \mathcal{K} \mid \nexists m_b : m_a \succ_M m_b\}$$

Decision Making in IGDA

- Using the Bayes' rule on the criterion of maximality :

$$\inf_{P_{Y|\mathbf{x}^*} \in \mathcal{P}_{Y|\mathbf{x}^*}} P(Y = m_a | \mathbf{x}^*) - P(Y = m_b | \mathbf{x}^*) > 0 \quad (2)$$

- We can reduce it to solving two different optimization problems :

$$\sup_{P \in \mathcal{P}_{X|m_b}} P(\mathbf{x}^* | y = m_b) \iff \bar{\mu}_{m_b} = \arg \max_{\mu_{m_b} \in \mathcal{P}_{\mu_{m_b}}} -\frac{1}{2}(\mathbf{x}^* - \mu_{m_b})^T \hat{\Sigma}_{m_b}^{-1}(\mathbf{x}^* - \mu_{m_b}) \quad (\text{BQP})$$

$$\inf_{P \in \mathcal{P}_{X|m_a}} P(\mathbf{x}^* | y = m_a) \iff \underline{\mu}_{m_a} = \arg \min_{\mu_{m_a} \in \mathcal{P}_{\mu_{m_a}}} -\frac{1}{2}(\mathbf{x}^* - \mu_{m_a})^T \hat{\Sigma}_{m_a}^{-1}(\mathbf{x}^* - \mu_{m_a}) \quad (\text{NBQP})$$

First problem box-constrained quadratic problem (BQP).

Second problem non-convex BQP

→ solved through Branch and Bound method.

Decision Making in IGDA

- Using the Bayes' rule on the criterion of maximality :

$$\inf_{Y|X^* \in \mathcal{P}_{Y|X^*}} P(Y = m_a | X^*) - P(Y = m_b | X^*) > 0 \quad (2)$$

- We can reduce it to solving two different optimization problems :

$$\sup_{P \in \mathcal{P}_{X|m_b}} P(X^* | y = m_b) \iff \bar{\mu}_{m_b} = \arg \max_{\mu_{m_b} \in \mathcal{P}_{\mu_{m_b}}} -\frac{1}{2} (X^* - \mu_{m_b})^T \hat{\Sigma}_{m_b}^{-1} (X^* - \mu_{m_b}) \quad (\text{BQP})$$

$$\inf_{P \in \mathcal{P}_{X|m_a}} P(X^* | y = m_a) \iff \underline{\mu}_{m_a} = \arg \min_{\mu_{m_a} \in \mathcal{P}_{\mu_{m_a}}} -\frac{1}{2} (X^* - \mu_{m_a})^T \hat{\Sigma}_{m_a}^{-1} (X^* - \mu_{m_a}) \quad (\text{NBQP})$$

- First problem box-constrained quadratic problem (BQP).
- Second problem non-convex BQP
 → solved through Branch and Bound method.

Cautious decision zone (example with 2 class)

Note the non-linearity boundary decision !!

Overview

- Classification
 - Motivation
 - Precise Decision
 - Discriminant Analysis
- Imprecise Classification
 - Imprecise Gaussian discriminant analysis
 - Cautious Decision
- Evaluation
 - Cautious accuracy measure and Datasets
 - Experimental results
- Conclusions and Perspectives

Datasets and experimental setting

- 9 data sets issued from UCI repository [2].
- 10×10-fold cross-validation procedure.
- Utility-discounted accuracy measure proposed to Zaffalon *et al* on [3].

$$u(y, \hat{Y}_M) = \begin{cases} 0 & \text{if } y \notin \hat{Y}_M \\ \frac{\alpha}{|\hat{Y}_M|} - \frac{1-\alpha}{|\hat{Y}_M|^2} & \text{else} \end{cases}$$

Goal : reward cautiousness to some degree α :

- $\alpha = 1$: cautiousness = randomness
- $\alpha \rightarrow \infty$: best classifier vacuous

Conclusions and Perspectives

Imprecise Gaussian Discriminant Classification

- ① Works done since submission of ISIPTA paper :
 - ✓ Considering the diagonal structure of the covariance matrix.
 - ✓ Releasing precise estimation of marginal distribution \mathbb{P}_Y to convex set of distributions \mathcal{P}_Y .
 - ✓ Considering a generic loss function \mathcal{L} instead of $\mathcal{L}_{0/1}$.
- ② What remains to do
 - ✗ Make imprecise the covariance matrix Σ_{m_k} by using a set of prior distributions (cf. Poster).
 - ✗ Making imprecise the components eigenvalues and eigenvectors of covariance matrix Σ_{m_k} .

Abstract

• **Setting:** Training data $D = \{x_i \in \mathbb{R}^n, y_i \in \mathcal{Y} \mid x_i \in \mathcal{X} \text{ where } \mathcal{X} = \mathbb{R}^n \text{ and } \mathcal{Y} = \{1, \dots, m\}\}$.

• **Methodology:** results obtained performed by the prior results in hard-to-perfect imbalanced instances by making continuous domains (Figure 1(a) and 1(b)).

• **Our proposal:**

• **Continuous domains:** assigns to a new instance x a set of possible labels $\mathcal{Y} \subseteq \mathcal{Y}$ in case of high uncertainty.

• **New criterion:** a criterion of Gaussian Discriminant analysis used to quantify the lack of evidence of the component P_{ij} (Figure 1(c)).

1.1. Problem Statement

Let $D = \{x_i \in \mathbb{R}^n, y_i \in \mathcal{Y} \mid x_i \in \mathcal{X} \text{ where } \mathcal{X} = \mathbb{R}^n \text{ and } \mathcal{Y} = \{1, \dots, m\}\}$ be a training data. Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)).

1.2. Near-imprecise Gaussian Discriminant Analysis

Let $D = \{x_i \in \mathbb{R}^n, y_i \in \mathcal{Y} \mid x_i \in \mathcal{X} \text{ where } \mathcal{X} = \mathbb{R}^n \text{ and } \mathcal{Y} = \{1, \dots, m\}\}$ be a training data. Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)).

1.3. Gaussian Discriminant Analysis

Let $D = \{x_i \in \mathbb{R}^n, y_i \in \mathcal{Y} \mid x_i \in \mathcal{X} \text{ where } \mathcal{X} = \mathbb{R}^n \text{ and } \mathcal{Y} = \{1, \dots, m\}\}$ be a training data. Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)).

1.4. Continuous and Imprecise

Let $D = \{x_i \in \mathbb{R}^n, y_i \in \mathcal{Y} \mid x_i \in \mathcal{X} \text{ where } \mathcal{X} = \mathbb{R}^n \text{ and } \mathcal{Y} = \{1, \dots, m\}\}$ be a training data. Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)).

1.5. Conclusions and Perspectives

Let $D = \{x_i \in \mathbb{R}^n, y_i \in \mathcal{Y} \mid x_i \in \mathcal{X} \text{ where } \mathcal{X} = \mathbb{R}^n \text{ and } \mathcal{Y} = \{1, \dots, m\}\}$ be a training data. Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)). Let P_{ij} be the probability of class j given class i (Figure 1(a)).
